The research memorandum summarizes an analysis carried out at the Center for Naval Analyses (CNA) to determine the timeliness of the Navy Enlisted Classification (NEC) reports to the Enlisted Master Record (EMR). Using quarterly EMR files from June 1983 to June 1984 and from June 1986 to June 1987, analysts estimated the NEC reporting lags (i.e., times between the date the NEC is awarded and the date the NEC is posted to an individual's EMR record). The results indicate that NEC reporting lags are relatively rare. Over 90 percent of the NECs appeared on the quarterly EMR within four months of their being awarded. Looking ahead only one quarter, therefore, seems to be sufficient for achieving a relatively complete count, whether one is estimating the number of new awards or determining the total count.

ABSTRACT

This research memorandum summarizes an analysis carried out at the Center for Naval Analyses (CNA) to determine the timeliness of the Navy Enlisted Classification (NEC) reports to the Enlisted Master Record (EMR). Using quarterly EMR files from June 1983 to June 1984 and from June 1986 to June 1987, analysts estimated the NEC reporting lags (i.e., times between the date the NEC is awarded and the date the NEC is posted to an individual's EMR record). The results indicate that NEC reporting lags are relatively rare. Over 90 percent of the NECs appeared on the quarterly EMR within four months of their being awarded. Looking ahead only one quarter, therefore, seems to be sufficient for achieving a relatively complete count, whether one is estimating the number of new awards or determining the total count.

TABLE OF CONTENTS

LIST OF TABLES

INTRODUCTION

Navy Enlisted Classification (NEC) codes identify an individual's particular skills in more detail than the Navy occupational or rating structure. To Navy detailers, trainers, and analysts, NECs reported to the Enlisted Master Record (EMR) files are an important source of information on valid earned qualifications and skills of enlisted personnel. Analysts at the Center for Naval Analyses (CNA) use NEC data on the CNA-held quarterly EMR files to examine both the amount and usage of skills held by personnel. Accurate and timely reporting of NECs to the EMR is important to CNA analysis as well as to manpower managers involved in day-to-day personnel policy.

This paper summarizes an analysis done at CNA on the timeliness of NEC reports to the EMR. The primary focus is on whether or not there is a lag in the reporting of new NECs to the EMR. A previous study[1] found that, for new NECs on the September 1985 (S85) EMR file, only 80 percent had FY 1985 award dates (9 percent had FY 1984 award dates, and 11 percent had FY 1983 or earlier dates). In that analysis, a new NEC was defined as an NEC that appeared on the S85 EMR but was not on the S84 EMR. In this memorandum, new NECs are defined as NECs that did not appear on the previous quarterly EMR.

It should be noted that the analysis summarized here deals only with NECs that are, at some point, recorded in the EMR. Some NECs never get reported to the EMR. The exact number is unknown and could be determined only by checking other data sources such as schoolhouse records and individuals' service records.[2]

The paper is organized as follows. In the next section, the reporting lags for NECs appearing on the March 1987 (M87) EMR are examined in detail. They are compared to the March 1984 (M84) EMR reporting lags to see if there are any significant changes. Several anomalies in NEC reporting are noted. The section that then follows provides preliminary estimates of the reporting lag, based on quarterly EMRs from June 1983 (J83) to June 1984 (J84) and June 1986 (J86) to June 1987 (J87). New NECs on those EMRs are tabulated by award date and by the date of their first appearance on the EMR. The reporting lag and the average proportion of NEC awards observed within at most zero to five months are computed. The final section of the paper discusses ways of accounting for unreported NECs in studies using NEC data.

---

1. CNA Research Memorandum 86-84, *The Navy Enlisted Classifications (NECs): A History*, by Aline Quester and George Corliss, Apr 1986.
2. Code 50 personnel of the Enlisted Personnel Management Center (EPMAC) are engaged in such a task. Between March 1986 and July 1987, they recovered almost 15,000 "lost" NECs.

The results of this NEC reporting analysis indicate that NEC reporting lags are relatively rare and that NEC undercounts caused by unreported NECs are small. Over 90 percent of NECs first appearing on the EMR were awarded four or fewer months previously. Whether one is estimating the number of new awards or the total inventory, looking ahead one quarter seems to be sufficient.

NEC REPORTING: A CROSS-SECTION LOOK

In this section, the distribution of the new NECs appearing in a given quarter is examined. Table 1 shows the distribution of new NECs on the March 1987 EMR by award date. A new NEC is defined as one that appears on the individual's record in March 1987 (M87) but does not appear on the December 1986 (D86) EMR record for that individual. The potential reporting lag (in months) is determined by comparing the award date of the NEC with the EMR date. An award date of March 1987 implies a report lag of 0 months; an award date of February 1987 implies a one-month lag; and so on. Because quarterly EMRs are used, the numbers in column two are an upper bound on the actual reporting lag. For example, NECs earned in January 1987 cannot be observed until March, so they are characterized as having a two-month lag, although the true reporting lag could be shorter.

Using these definitions, the total number of new NECs on the M87 EMR is slightly over 20,000. Of these, 614 (3 percent) had missing award dates. There were also over 500 NECs with award dates after March 1987. A further investigation of this anomaly is summarized in table 2, which gives the distribution of the NECs with post-March 1987 award dates by NEC group. The NECs are grouped based on the first two digits of the NEC.[1] The majority of NECs with post-March 1987 award dates (about 53 percent) are coded with 99XX. Reference to the October 1985 and July 1987 NEC manuals revealed only one 99XX NEC code. NEC 9901, titled Nuclear Propulsion Operator Trainee, identifies personnel recruited for nuclear propulsion training. Although considered a Special Series NEC, it seems its function is more closely related to an Entry Series NEC, which identifies personnel in training for a rating.

Of the NECs with post-March 1987 award dates, 92 were in the 83XX group, which includes aircraft systems maintenance personnel. Some 83XX NECs require both formal (schoolhouse) and on-the-job (OJT) training. It appears that these NECs were posted to the EMR after completion of the schoolhouse requirement but prior to completion of OJT, although the award date posted included the additional time required for the award. Interestingly, all the NECs with post-March 1987 award dates have dates of at most one month in the future.

---

1. NECs for a given source rating are identified, in general, by the first two digits.

99XX	273	0.53

Returning to table 1 and the distribution of M87 new NECs by length of reporting lag, over 91 percent of the NECs[1] have award dates within four months of when they are first reported. NECs with a potential reporting lag of greater than four months are fairly evenly distributed across months. The pattern is quite similar for the NECs on the M84 EMR, as can been seen from table 3. It does not appear that the timeliness of NEC reporting has changed that much; 92 percent of NECs in M84 have award dates within four months.

Further examination of the new NECs in M84 and M87 revealed that, for many of these NECs, there was a different NEC on the preceding EMR (D83 or D86) with the same award date. Because it seems unlikely that an individual is awarded more than one NEC in a month, a further investigation of these NECs seemed important. Table 4 gives the distribution by NEC group of new NECs (in both M84 and M87) with the same award date as an old NEC. A listing of the new and old NECs for M87 is given in

1. Excluding NECs with a future award date or no award date.

appendix A. Except for a few anomalies, the switch in the NECs is within an NEC group and often involves component or related NECs.[1]

For M87 the majority of these NECs (over 71 percent) are in the 28XX group. In fact, all of these are NEC 2822 on the M87 EMR, replacing NEC 2817 on the D86. The NEC manual indicates that NEC 2822 is a new NEC that identifies individuals with NEC 2817 plus 12 months' experience in a relevant billet. It appears that when the NEC was created, all those individuals with 2817 and the required experience were awarded 2822, but the award date of 2817 was used. Similar explanations can be given for the other cases in table 4.

For this set of NECs, therefore, the delay in NEC reporting is more apparent than real. The true award dates for these NECs probably fall primarily in the three months preceding the EMR. Table 5 shows the distribution of these NECs by the length of the apparent reporting lag. It can be seen that, as the reporting lag increases, NECs with the same award dates as an old NEC account for an increasingly large proportion of the total. Over 60 percent of the NECs with a lag of greater than 12 months are NECs of this type. Whether other NECs that appear to be reported with a lag are also the result of reporting policy is unknown. In any case, these findings indicate that use of the NEC award date from the EMR can occasionally be misleading.

TIME-SERIES ESTIMATION OF REPORTING LAGS

In each of the two quarters examined in the preceding section, it was found that over 91 percent of the new NECs had award dates within four months of when they first appeared on the EMR. If the number of NECs awarded is the same from month to month, and if the observed patterns of reporting are representative, then this result implies that 91 percent of the NECs awarded in a given month will appear on the EMR within four months of their award date. Because it is not clear that the number of NECs awarded is constant over time, further investigation of reporting delays seemed worthwhile.

---

1. The NEC manual distinguishes principal, component, and related NECs. A component NEC is a prerequisite for a principal NEC, while a related NEC has a "significant relationship to a principal NEC" but is not a prerequisite for it. When an individual earns a principal NEC, any component or related NECs are removed from his or her record.

Two sets of five consecutive quarterly EMRs were used to tabulate NECs by award date and report date. Table 6 displays the results for the June 1986 to June 1987 set and table 7 displays the results for the June 1983 to June 1984 set. For each award date, the number of NECs that first appeared on each of the five EMRs is shown. For example, there were 2,765 NECs first observed on the J86 EMR with June 1986 award dates. The last column in each table, labeled total, gives the sum of NECs on the five EMRs for each award month. For instance, 7,613 NECs with an award date of June 1986 first appeared on one of the five EMRs. Several totals were not computed, as the five EMRs examined do not allow for estimation of the total number of awards.[1]

The distributions in tables 6 and 7 can be used to estimate the proportion of NECs reported with various lags. Because only quarterly EMRs are available, only certain months can be used to estimate each proportion. For example, only March, June, September, and December data can be used to estimate the fraction of NECs reported in less than a month; only February, May, August, and November data can be used to estimate the fraction of NECs reported with a lag of one month or less; and so on. The results of these calculations, along with average proportions, are shown in tables 8 and 9 for the two distributions.

Looking first at the J86 to J87 results (table 8), the proportion of NECs with a lag of less than four weeks varies from 36 percent for June 1986 awards to over 70 percent for March 1987 awards.[2] On average, a little over half (52 percent) of NECs have at most a four-week reporting lag. For the J83 to J84 set (table 9), 59 percent of NECs have a four-week reporting lag, on average. By the next month, the proportion of NECs reported increases substantially. Between J86 and J87, on average, 92 percent of NECs awarded are reported in the same month or within the next month. This average increases slightly, to 94 percent, for NECs awarded between J83 and J84. Because the remaining 8 (6) percent include the NECs with award dates that should not be used to examine reporting lag (e.g., award date of component NEC), between 92 (94) percent is conservative. Note that for both sets there has been much more variation over time in the proportion of awards observed within a month than in the proportions of awards having greater lags.

---

1. All the totals are underestimates of the true number of NEC awards, as some awards are not reported for many months and some are never reported.

2. It should be kept in mind that the underestimation of the total number of NECs (and resulting overestimation of the fraction of NECs reported) is more severe for more recent award dates.

5	Apr 83	Sep 83	.96	.98
	Jul 83	Dec 83	.99	
	Oct 83	Mar 84	.99	

Note: The reporting lag is the maximum reporting lag, i.e., for one month it is at most one month and includes all NECs with less than one-month lag.

CONCLUSION

It is obvious that there are lags in reporting NECs to the EMR. However, the analysis here implies that the delays are not as severe as previously thought. The next question is: How should the lags be accounted for in studies using NEC data?

To some extent, the answer to this question depends on the problem at hand. Two NEC variables that are often used are the number of NECs awarded during a specific period of time (such as a fiscal year) and the total NEC inventory. Because it is the most recent awards that are undercounted the most, looking only at current data will lead to a more severe underestimate of new awards than of the total inventory.

There are two possible solutions to undercounts of NECs resulting from reporting lags. One is to use later quarters of data. Consider first the problem of measuring the number of new NEC awards. The left side of table 10 shows how many NECs would be added to the count of NECs awarded in the previous year, starting from various dates, by looking ahead one or two quarters. Assuming that NECs were being awarded at an annual rate of 85,000 during this period, in the worst case (June 1986) 7.5 percent of the previous year's awards would not be observed until the following quarter.

The right side of table 10 shows how many NECs would be added to the NEC inventory by looking ahead one or two quarters. Using the September 1986 NEC inventory (375,751) as a base, in the worst case (again June 1986) less than 2 percent would be added to the inventory by looking ahead one quarter.[1] Whether estimating the number of new awards or the total inventory, looking ahead one quarter seems to be sufficient; looking ahead to a second quarter does not add many NECs.

For recent data, it is not possible to look ahead one or two quarters. In this case, if past estimates of the reporting lag are felt to be reliable, they can be used to adjust current data upward to account for unreported NECs. Tables 8 and 9 indicate that while it might be difficult to estimate the total number of NECs awarded in the current month from EMR data, NEC awards for previous months can be estimated with a fair degree of certainty.

---

1. If NECs with the same award date as an old NEC were screened out, the percentage would be even smaller.

TABLE 10

NUMBER OF NECs ADDED BY LOOKING AT FUTURE EMRs

Base quarter	Number from previous 12 months: One quarter ahead	Number from previous 12 months: Two quarters ahead[a]	Number from all previous months: One quarter ahead	Number from all previous months: Two quarters ahead[a]
Mar 86	5,653	1,226	6,705	1,951
Jun 86	6,333	1,106	7,302	1,866
Sep 86	4,648	664	5,515	1,574
Dec 86	4,768	539	5,773	820
Mar 87	3,204	NA	3,541	NA

a. Number of NECs in addition to those found one quarter ahead.

APPENDIX A

LISTING OF NECs WITH AWARD DATES OF PREVIOUS NEC

APPENDIX A

LISTING OF NECs WITH AWARD DATES OF PREVIOUS NEC

Table A-1 is a listing of the NECs that first appeared on the M87 quarterly EMR and that had the same award date as a different NEC on the D86 EMR. The records are sorted first by old NEC, then by award date. The month and year columns are the difference between the award date and M87 measured in months and years, respectively.

APPENDIX B

SUPPORTING DATA TABLES

APPENDIX B

SUPPORTING DATA TABLES

This appendix contains supporting data for tables 6 and 7 of the text. Tables B-1 through B-4 are similar to table 1 of the text for the other EMR quarters (from June 1986 to June 1987) used to construct table 6. Tables B-5 through B-8 are similar to table 3 of the text for the other quarters (between June 1983 and June 1984) used to construct table 7.
